1	com.facebook.katana	privacy at least put some option appear offline. i mean for some people like me it's a big pressure to be seen online like you need to response on every message or else you be called seenzone only. if only i wanna do on facebook is to read on my newsfeed and just wanna response on message i want to. pls reconsidered my review. i tried to turn off chat but still can see me as online.	0
2	com.facebook.katana	messenger issues ever since the last update, initial received messages don't get pushed to the messenger app and you don't get notification in the facebook app or messenger app. you open the facebook app and happen to see you have a message. you have to click the icon and it opens messenger. subsequent messages go through messenger app, unless you close the chat head... then you start over with no notification and having to go through the facebook app.	0
3	com.facebook.katana	profile any time my wife or anybody has more than one post and i view them it would take me to there profile so that i can view them all at once. now when i try to view them it tells me that the page that i requested is not available. i've restarted my phone i even cleard the cache and i've uninstalled and reinstalled the app and it is still doing it. please fix it thank you	0
4	com.facebook.katana	the new features suck for those of us who don't have a working back button can you guys make the videos able to be slid to the left to exit the video. as i have to force close facebook to exit	0
5	com.facebook.katana	forced reload on uploading pic on replying comment last night i tried to reply a comment by uploading a photo from my phone. when i press on the button to select photos the app automatically goes back to the main page. on other occasions, i could enter to my gallery to select my image but as soon as i selected an image and press done, the program, again, forced reload and suddenly go back to the main page. please fix this and i will change my rating. thank you.	0
6	com.facebook.katana	idk i can't edit my posts? things such as my profile picture, when i edit it, it becomes grey and says that it is no longer available. please fix. i have an htc desire. will rate 5 stars shown fixed Ä‘ÂŸÂ˜Â”	0

A data.frame: 6 × 3

	ï..package_name	review	polarity
	<chr>	<chr>	<int>
886	com.rovio.angrybirds	too many ads far more adverts than any other game i've played. i know it's free and they need the ads to make a profit but there needs to be a balance.	1
887	com.rovio.angrybirds	loved it i looooooooooooooovvved it because it is incredible awesome and it's in go power and make a new clash of clans the same thing butt better	1
888	com.rovio.angrybirds	all time legendary game the birthday party levels and short fuse levels are fantastic.especially when the pigs crash onto different chemicals is just great.suggestion to all those players who cringe about too much ads is close ur wi-fi connection and then play the game.then the ads won't trouble you.	1
889	com.rovio.angrybirds	ads are way to heavy listen to the bad reviews. there are ads after every round, whether you pass it or fail it. sometimes there are ads before the next round starts to. you spend more time on ads than game play. i develop web apps, and honestly many people rely on ads to make a living. i can appreciate that all to well. however, these developers have went far beyond that. frankly, they are disrespectful nitwits.	0
890	com.rovio.angrybirds	fun works perfectly well. ads aren't as annoying as you think, especially for a free game.	1
891	com.rovio.angrybirds	they're everywhere i see angry birds everywhere because i can't stop playing this game. get out my head devs! 4 Ä´ÂŸÂŒÂŸ because nothing's perfect	1

Analisis de dominio

Como primer punto a destacar, observamos que nuestra base de datos de texto se encuentra en ingles. Con lo cual, al limpiar las palabras para armar una matriz lo mas pura posible, tendremos que tener en cuenta estructuras de este idioma. Como por

ejemplo: cuales son sus acentos, cuales son sus signos de exclamacion e interrogacion, si tienen letras particulares que no ayuden a la comprension del texto, si utilizan o no utilizan el apostrofe para separar palabras, si se encuentran dobles o triples espacios, si tienen sustantivos o adjetivos separados por genero por una letra, etc.

▶ **Levels**:

Transformacion de los datos

En este apartado tenemos el objetivo de crear una matriz de palabras, en donde cada columna represente una palabra y cada linea contendra la observacion. Con lo cual, si la palabra de la columna 1 aparece dos veces en la observacion 10, tendremos un 2 en la fila 10 columna 1. Esto nos permitira conocer las distribuciones de las palabras, conocer cuales son las que aparecen mas y empezar a tener cierta aproximacion a los parametros comunes de todos nuestros reviews. Recordemos que el objetivo de este practico es lograr entrenar un modelo capaz de clasificar comentarios que esten cargados de sentmientos. Para esto utilizaremos dos funciones: la primera sera VectorSoruce() que nos permitira darle separabilidad a cada fila construida como si fuese un documento, y la segunda es VCorpus(), que nos permitira almacenar la coleccion de datos. Al darle una estructura matricial binaria, este almacenamiento presentara mejoras de eficiencia computacional. Ademas, el tipo de almacenamiento corpus tiene funciones que nos permiten manipular textos de forma eficiente.

In [10]:
```
data_corpus = VCorpus(VectorSource(data$review),readerControl = list(language =
print(data_corpus)
```

```
<<VCorpus>>
Metadata:  corpus specific: 0, document level (indexed): 0
Content:  documents: 891
```

Si bien, por lo que vimos a simple vista no habia mayusculas utilizadas en los reviews, igualmente pasaremos un filtro general para transformar todas las mayusculas posibles existentes en minusculas.

In [11]:
```
# Esta transformación cambia todas las mayúsculas a minúsculas
data_corpus_clean = tm_map(data_corpus, content_transformer(tolower))
# Visualización de la instancia antes y después de la transformación
print(lapply(data_corpus[[891]][1], as.character))
print(lapply(data_corpus_clean[[891]][1], as.character))
```

```

```

Aqui vemos como transforma los comentarios para simplificar el vocabulario utilizado. Sin embargo, en este caso al eliminar "the only and" y dejar unicamente "major problem" podria desviar la review hacia una review negativa.

Vemos como nos simplifica muchisimo nuestras reviews. Sin embargo, tenemos perdidas a niveles estructurales. Para el caso de la subject number 2, vemos por ejemplo que nothing fue cambiada por noth, ya que saco su ing que es un componente verbal, pero que en este caso no toma es representacion, como asi tambien el caso de de issues "problemas", cuando le quita el plural borra la e que corresponde a la anatomia del singular de la palabra "issue". Igualmente, no deja de ser util este filtro para normalizar nuestro data set y poder agrupar en menor cantidad de columnas nuestras palabras. (perdi el comentario porque en principio estaba mezclando los datos para tener un orden aleatorio. Sin embargo, no deja de ser util el comentario).

```

Para mejorar la calidad de nuestro analisis, procedemos a limpiar los emojis del texto. Al eliminar estos caracteres especiales, garantizamos que nuestro conjunto de datos este compuesto principalmente por palabras, lo que nos permite realizar un analisis más preciso y detallado. Esta accion nos ayuda a optimizar nuestro proceso de analisis y a obtener resultados mas confiables y significativos. Ademas, volvemos a realizar todos los pasos anteriores pero ahora de manera conjunta:

Clasificador Naive Bayes

Naive Bayes es un algoritmo de aprendizaje supervisado usado para clasificacion y modelado predictivo. Funciona calculando la probabilidad condicional de que una instancia pertenezca a una clase especifica dado un conjunto de caracteristicas observadas previamente. Este modelo hace una suposicion simplificada de independencia condicional entre las caracteristicas, lo que significa que asume independencia entre si dado el valor de la clase.

In [37]:
```
convert_counts = function(x) {
  x = ifelse(x > 0, 1, 0)
  x = factor(x, levels = c(0, 1), labels=c("Nulo", "No Nulo"))
  return (x)
}

# apply() allows us to work either with rows or columns of a matrix.
# MARGIN = 1 is for rows, and 2 for columns
reduced_dtm.train = apply(reduced_dtm.train, MARGIN=2, convert_counts)
reduced_dtm.test  = apply(reduced_dtm.test, MARGIN=2, convert_counts)
```

In [38]:
```
# Almacena nuestro modelo en subject_classifier
subject_classifier <- naiveBayes(x = reduced_dtm.train,  # Dataset de entrenamie
                                 y = data.train$polarity)  # Target de entrenam

# Realiza predicciones utilizando el modelo creado con los datos de entrenamient
subject_test.predicted <- predict(subject_classifier,  # Modelo
                                  newdata = reduced_dtm.test)  # Dataset de test
```

In [39]:
```
# Ahora sacamos el confusion matrix
confusionMatrix(subject_test.predicted, data.test$polarity)
```

Laplace Smoothing

El suavizado de Laplace es una tecnica que se puede utilizar en la clasificación de texto con el algoritmo de Naive Bayes. Esta herramienta ayuda a resolver el problema de la probabilidad cero, que puede surgir cuando una palabra presente en el conjunto de prueba no esta en el conjunto de entrenamiento. Este problema toma una mayor relevancia cuando tratamos con un texto de amplio vocabulario.

El modelo muestra una precision aceptable del 82%. No obstante, al evaluar las predicciones con el archivo original, se evidencian algunas consideraciones. En primer lugar, se encuentran reviews en diferentes idiomas, incluyendo espaniol, mientras que el modelo se entreno exclusivamente en ingles. Es claro que el modelo no podra predecir con precision en estos casos, dado que todas las transformaciones se basaron en la estructura del ingles. En segundo lugar, se observa que la base de datos original contiene errores de etiquetado. Por ejemplo, hay casos en los que comentarios con carga emotiva positiva estan clasificados erroneamente como polaridad = 0, como en el caso de "neat nice, smooth, speed but downloading is lacking in speed correct this I'll give u 5 star". Este comentario incluye adjetivos positivos junto con una critica sobre la velocidad de descarga, lo cual deberia haber sido etiquetado como polaridad = 1. En tercer lugar, al remover emojis de los comentarios, se logró una limpieza adicional del texto y una mejora en la precision del modelo, pasando de aproximadamente un 74% a un 82% final. Por ultimo, se aplico Laplace para ajustar el modelo frente a casos de probabilidad cero entre los datos de entrenamiento y prueba. Sin embargo, no se observo una variacion

significativa en la precision. Esto podria deberse a que el vocabulario del texto es limitado, lo que resulta en pocas palabras presentes en el conjunto de prueba pero ausentes en el conjunto de entrenamiento.
